

The logo for Data Saturdays. It features the word "DATA" in a large, bold, dark blue sans-serif font. To the left of the "D" is a blue icon consisting of three horizontal bars of increasing length, resembling a stylized "D" or a data bar chart. Below "DATA", the word "SATURDAYS" is written in a smaller, blue, all-caps sans-serif font, with wide letter spacing.

The logo for engage labs. The word "engage" is written in a lowercase, rounded sans-serif font. The "e" at the start is dark blue and features a stylized eye or camera lens icon. The "n" and "g" are in a medium blue. The "a" and "c" are in a light green. The "e" at the end is a yellowish-green and also features a stylized eye or camera lens icon. Below "engage", the word "LABS" is written in a small, dark blue, all-caps sans-serif font, with wide letter spacing.

Better database design with Local Development Experience for Azure SQL

- Local Development Experience for Azure SQL
- Why?
- What?
- How
- Demo
- Demo
- ...
- Demo

Before we start...

This is the only prerequisite for this session...

Why?

This scenario happens quite often

Benefits

Solves development concurrency on database

Eliminates instable/untested deploy on database

Enable offline development/testing

Improve segregation of duties

What?

Microsoft says...

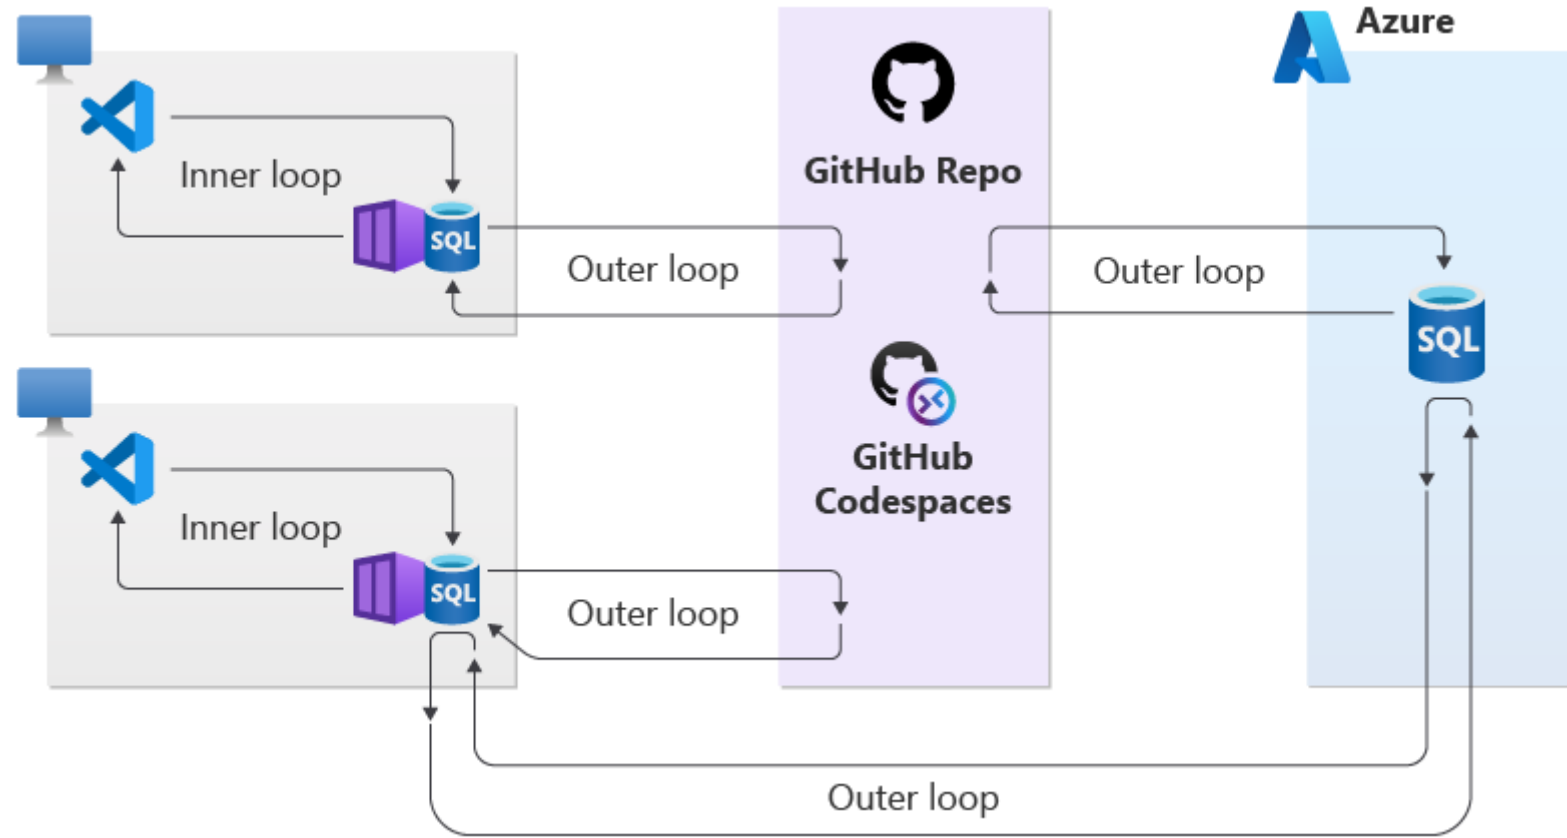

*“The local development experience uses the **emulator** as a runtime host for **Database Projects** that can be **published and tested locally** as part of a developer's inner loop.”*

[What is the local development experience for Azure SQL Database? - Azure SQL Database | Microsoft Docs](#)

So what?

This makes much more sense now, doesn't it?

How?

Setup your environment (docs way)

mssql

What is docker? I'm not an expert but...

Docker is platform that allows **app creation**, **testing** and **distribution** easily and fast.

All you need is in the container.

Docker, why?

- Azure SQL Database emulator is a **containerized database** with **close fidelity** to the Azure SQL Database public service.
- The Azure SQL Database emulator is implemented as a **Docker container**
- Dev pulls the Azure SQL Database emulator from the **Microsoft Container Registry**

Emulator, not a copy...

Based on Azure SQL Edge therefore there're some limitations:

- Spatial data types
- Memory-optimized tables in in-memory OLTP
- HierarchyID data type
- Full-text search
- Azure Active Directory Integration

Instead all of this talking, let's do
what?

Let's head over to my laptop

Demo suggested tools

Pros

- ADS dev/execution/management/test in one tool

Cons

- No solution Tools
- Not ready yet
 - No properties for project
 - No easy file movement
 - No interface for database references
 - ...
